Week 6 Lab 1: Initial Class Diagram

Purpose

This initial diagram supports the guided refactoring of:

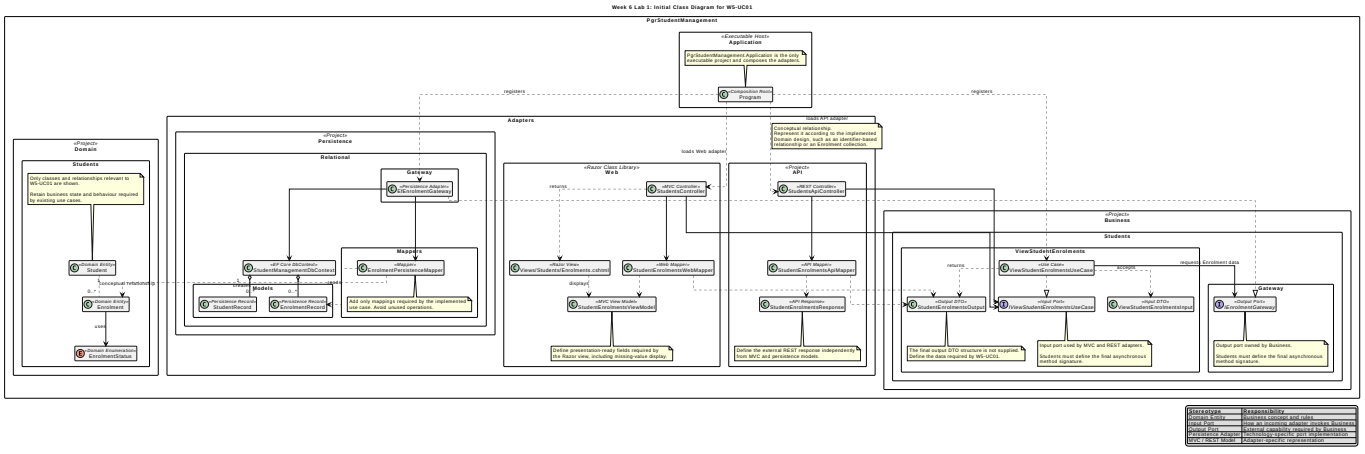

```
W5-UC01: View Student Enrolments
```

It provides an architectural skeleton rather than a completed implementation design. It identifies the principal responsibilities, ports, adapters, and permitted dependency directions, while leaving you to decide and implement:

- Final properties and collections.
- Asynchronous method signatures.
- Business DTO fields.
- MVC view-model fields.
- REST response fields.
- Mapping operations.
- Empty-result handling.
- Exact namespaces and registration classes.

You will revise and complete the diagram during Lab 2 so that it represents your actual implementation.

PlantUML

Reading the Diagram

- `IViewStudentEnrolmentsUseCase` is the **input port** used by the MVC and REST adapters.
- `IEnrolmentGateway` is the Business-owned **output port** used to request Enrolment data.
- `EfEnrolmentGateway` is an outgoing persistence adapter that implements the output port.
- MVC and REST use separate adapter models and mappers.
- Persistence records remain separate from Domain entities.
- `PgrStudentManagement.Application` is the only executable project and the composition root.
